IMPLEMENTATION FILESYSTEM

`inotify(7)` Miscellaneous Information Manual `inotify(7)`

NAME

`inotify` - monitoring filesystem events

DESCRIPTION

The `inotify` API provides a mechanism for monitoring filesystem events. Inotify can be used to monitor individual files, or to monitor directories. When a directory is monitored, inotify will return events for the directory itself, and for files inside the directory.

The following system calls are used with this API:

- **`inotify_init(2)`** creates an inotify instance and returns a file descriptor referring to the inotify instance. The more recent **`inotify_init1(2)`** is like **`inotify_init(2)`**, but has a `flags` argument that provides access to some extra functionality.
- **`inotify_add_watch(2)`** manipulates the "watch list" associated with an inotify instance. Each item ("watch") in the watch list specifies the pathname of a file or directory, along with some set of events that the kernel should moni-

page `inotify(7)` line 1 (press h for help or q to quit)
